

Retrofit Roof Systems

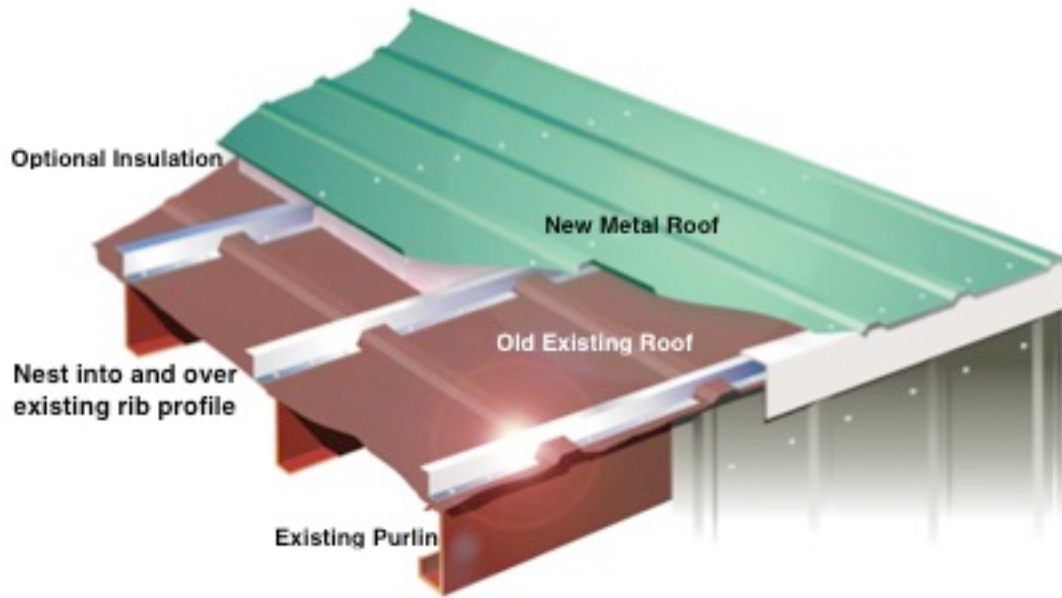

Retrofitting an Old Roof is the Best Way to Re-Roof

Is your metal building plagued with roof leaks? Roof fixes that aren't lasting? Heating and cooling costs have increased? No time to shut down business during repairs?

With a Retrofit Roof System there is no need to remove the old roof with business interruption and possible weather damage.

A Retrofit Roof System is a new metal roof over an existing structurally correct metal roof. It can fit any existing roof metal panel, support any new roof panel, and be configured to add insulation and solar energy equipment between the old and new roofs.

For the best results, don't try steel hat-sections (subject to wind uplift failures) or wood framing (pressure treated wood attacks steel panels) over old panel ribs or repeated quick fix coatings – install a Retrofit Roof System.

Benefits:

- Old Roof Stays – No Business Disruption
- Insulation is Easily Added for Energy Savings
- New Roof can have 20-Plus Year Weathertight Warranty
- Meets New Stringent Building Code Requirements
- Extensively Tested for ASTM-1592 Wind Uplift
- American Made with 16 gauge 50KSI, G-90 Steel
- Labor Saving – Minimal Prep Time
- Precision Pre-Punched for Anchoring
- Fast Project Completion

Metal Building Parts & Sales supplies all the parts to a metal building as well as repairs, inspections, and complete building packages. We are your resource for the unusual part or repair as well as everyday pieces and parts.
